

SolutionFull Length Test – 01**Ans. 1: (d)****Solution:** Let the four digit number be 'aaab' or 'baaa'Since the number has to be a multiple of 9, therefore $3a + b$ should be either 9, 18, 27.Case I: $3a + b$

Possible cases are

(1116, 6111, 2223, 3222, 3330, 9000)

Case II: $3a + b = 18$

Possible cases are

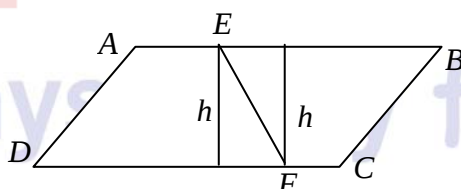

(3339, 9333, 4446, 6444, 5553, 3555, 6660)

Case III: $3a + b = 27$

Possible cases are

(6669, 9666, 8883, 3888, 7776, 6777, 9990)

Hence the total number of required numbers = 20

Ans. 2: (b)**Solution:** Let A_1 and A_2 be the areas of trapeziums $AEDF$ and $EBCF$ respectively. Let h be the common heights of these trapeziums.Given, $AB = 20\text{cm}$, $AE = 3\text{cm}$

Therefore,

$$EB = 20 - 3 = 17\text{cm}$$

$$DC = AB = 20\text{cm}$$

$$FC = 20 - DF$$

$$A_1 = \frac{1}{2} \times (AE + DF) \times h = \frac{1}{2} \times (3 + DF) \times h$$

$$A_2 = \frac{1}{2} \times (FC + EB) \times h = \frac{1}{2} \times (20 - DF + 17) \times h$$

From the question

$$A_1 = A_2$$

$$\Rightarrow \frac{1}{2} \times (3 + DF) \times h = \frac{1}{2} (20 - DF + 17) \times h$$

$$\Rightarrow 3 + DF = 37 - DF$$

$$\Rightarrow 2DF = 34 \Rightarrow DF = 17 \text{ cm}$$

Ans. 3: (c)

Solution: $6 \times 7 + 5 \times 6 = 42 + 30 = 72$

$$7 \times 8 + 4 \times 5 = 56 + 20 = 76$$

$$8 \times 9 + 2 \times 3 = 72 + 6 = 78$$

Ans. 4: (a)

Solution: B lives on top floor. Since D lives between B and F . D will be just below B and just above F . Since there are two persons between F and G . Hence the position of G will be second from bottom combining two statements (a). There is exactly one person between C and E and (b). E and A live on successive floors we can say that C lives on bottom floor, E lives on third floor and A lives on fourth floor.

Ans. 5: (d)

Solution: 35-----

There are 8 ways to fill the place after '5'. The next place can be filled in 7 way and the next place can be filled in 6 way. The last place can be filled in 5 ways.

Hence total numbers of telephone numbers

$$= 8 \times 7 \times 6 \times 5 = 1680$$

Ans. 6: (b)

Solution: Let us denote the cost price and the selling price by CP and SP respectively.

From the question

$$18,000 - CP = CP - 16,800$$

$$\Rightarrow 2(CP) = 18,000 + 16,800 = 34,800 \Rightarrow CP = 17,400$$

Hence in order to make a profit of 25%, the watch should be sold for

$$17,400 \times \frac{125}{100} = 21,750$$

Ans. 7: (d)

Solution: A leap year has 52 weeks and 2 days. In order to ensure that there are exactly 52 Sundays, none of the last two days should be a Sunday. Hence the problem reduces to 'What is the probability that none of the last two days is a Sunday'.

Sample space

$$= \{(\text{Sun, Mon}), (\text{Mon, Tue}), (\text{Tue, Wed}), (\text{Wed, Thus}), (\text{Thus, Fri}), (\text{Fri, Sat}), (\text{Sat, Sun})\}$$

Out of these 7 outcomes 5 outcomes are favorable to the required event.

Hence required probability = $\frac{5}{7}$.

Ans. 8: (b)

Solution: Let initially there be $2x, 3x$ and $5x$ students in the three classes. Also suppose that after increase the number of students in the three classes becomes $4y, 5y$ and $7y$.

From the question

$$2x + 20 = 4y \quad \text{(I)}$$

$$3x + 20 = 5y \quad \text{(II)}$$

$$5x + 20 = 7y \quad \text{(III)}$$

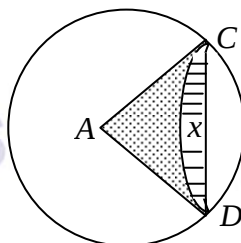

Solving these equations we obtain

$$x = y = 10$$

Therefore, total number of students before increases = $2x + 3x + 5x = 10x = 10 \times 10 = 100$

Ans. 9: (c)

Solution:

Area of each circle = $\pi (6)^2 = 36\pi \text{ cm}^2$

Hence, area of sector ACD = area of sector

$$BCD = \frac{36\pi \text{ cm}^2}{6} = 6\pi \text{ cm}^2$$

Now consider the left circle. Triangle ACD is an equilateral triangle.

Area of triangle ACD

$$= \frac{\sqrt{3}}{4} (6)^2 = 9\sqrt{3}$$

Area of region $x = 6\pi - 9\sqrt{3}$

Hence total area of the shaded region

$$\begin{aligned} &= 2(9\sqrt{3}) - 2(6\pi - 9\sqrt{3}) \\ &= 18\sqrt{3} - 12\pi + 18\sqrt{3} = 36\sqrt{3} - 12\pi \end{aligned}$$

Ans. 10: (b)

Solution: Since they walk in opposite directions their relative speed is $2 + 3 = 5$ rounds per hour.

Therefore, they cross each other 5 times in 1 hour and 2 times in $\frac{1}{2}$ hour.

Time duration from 8 AM to 9:30 AM = 1.5 hour.

Hence the cross 7 times before 9:30 AM.

Ans. 11: (d)

Solution: Total number of days in a leap year = 366. In 52 complete weeks each day will occur once. This means during these 52 weeks there will be 52 Saturdays and 52 Sundays. Since every second Saturday and every fourth Saturday is a holiday, hence there will be $\frac{52}{2} = 26$ Saturdays which are holiday.

Hence total number of holidays during 52 complete weeks = $26 + 52 = 78$

The 365th day will be Friday and 366th day is a Saturday. Since 366th day is not second Saturday. Hence this will not be a holiday. Total holidays during the leap year = 78

Total working days = $366 - 78 = 288$

Ans. 12: (b)

Solution: The hour hand moves at 0.5° per minute.

The minute hand moves at 6° per minute.

The angle between minute hand and our hand should be 180° in our case.

Suppose they coincide for the first time after t minutes (Assuming that both the hour hand and minute hand point towards the '12' mark initially).

$$\begin{aligned} \text{Hence, } 6t - 0.5t &= 180^\circ \\ \Rightarrow 5.5t &= 180^\circ \Rightarrow t = \frac{360}{11} \end{aligned}$$

Hence they will first coincide after $\frac{360}{11}$ minutes

Hence in one day (= 720 minutes) they will coin coincide

$$\frac{720}{360/11} \text{ times} = 22 \text{ times.}$$

Ans. 13: (c)

Solution: After melting the ratio of copper to nickel = 5:11

Hence amount of copper in the final alloy

$$= 20 \times \frac{5}{16} = \frac{25}{4} \text{ kg}$$

Amount of nickel in the final mixture

$$= 20 \times \frac{11}{16} = \frac{55}{4} \text{ kg}$$

Let the amount of copper and nickel in the first bar be $2x$ and $5x$ and in the second bar $3y$ and $5y$ respectively, then

$$2x + 3y = \frac{25}{4}$$

$$\Rightarrow 8x + 12y = 25 \quad \text{(I)}$$

$$\text{Also, } 5x + 5y = \frac{55}{4}$$

$$\Rightarrow 4x + 4y = 11 \quad \text{(II)}$$

Multiplying equation (II) by 2 and subtracting it from equation (I) gives

$$4y = 25 - 22 \Rightarrow y = \frac{3}{4}$$

Therefore equation (II) gives

$$x = \frac{11 - 4y}{4} = \frac{11 - 3}{4} = 2$$

Hence total weight of first alloy

$$= 2x + 5x = 7x = 7 \times 2 = 14 \text{ kg}$$

Ans. 14: (b)

Solution: Between 10^1 and 10^2 there are two integers 11 and 20 such that the sum of their digits is 2.

Between 10^2 and 10^3 there are three integers 110, 101 and 200 such that their digit sum is 2.

We can generalize this and say that between 10^n and 10^{n+1} , there are $(n+1)$ integers whose digit sum is 2.

Hence between 10^6 and 10^7 there are 7 positive integers such that the sum of their digits is 2.

Ans. 15: (a)

Solution: Let us say that students have weights a, b, c, d and e . We assume that the weights of students form nondecreasing sequence.

From the question

$$a + b + c + d = 160$$

and, $b + c + d + e = 180$

The total weight of the students can be written in the following ways

(a) $160 + e$ or, (b) $180 + a$

Hence e is 20 more than a

The highest possible average. This will occur when $a = b = c = d = 40$ and $e = 60$

Hence the highest possible average of class

$$= \frac{160 + 60}{5} = 44$$

The least possible value of e will give the minimum possible average. In this case

$$b = c = d = e = 45 \text{ and } a = 25$$

Hence minimum possible average

$$= \frac{180 + 25}{5} = 41$$

Hence the difference between maximum possible average and minimum possible average

$$= 44 - 41 = 3 \text{ kg}$$

Ans. 16: (b)

Solution: The volume of larger cube $= 5^3 = 125 \text{ cm}^3$

Volume of each smaller cubes $= 1^3 = 1 \text{ cm}^3$

Hence there will be 125 smaller cubes.

Surface area of larger cube $= 6 \cdot 5^2 = 150 \text{ cm}^2$

Total surface area of smaller cubes $125 \cdot 6 = 750 \text{ cm}^2$

Hence, $\frac{\text{Surface area of larger cube}}{\text{Total surface area of smaller cube}} = \frac{150}{750} = \frac{1}{5}$

Hence the required ratio $= 1:5$

Ans. 17: (d)

Solution: The percentage increase in 1996.

$$= \frac{40 - 25}{25} \times 100 = 60\%$$

Percentage in 1997 $= \frac{60 - 40}{40} \times 100 = 50\%$

Percentage increase in 2001 $= \frac{75 - 50}{50} \times 100 = 50\%$

Percentage increase in 2002 $= \frac{80 - 75}{75} \times 100 = \frac{20}{3} \%$

Hence percentage increase in 1996 as compared to previous year is maximum.

Ans. 18: (c)

Solution: At $t = 4s$, the velocity of first stone is $v_1 = 98 - (9 \cdot 8) \times 4 = 98 - 39 \cdot 2 = 58 \cdot 8 m/s$.

At $t = 4s$, the velocity of second stone $= 0 - (9 \cdot 8) \times 4 = -39 \cdot 2 m/s$

$$\begin{aligned} \text{Hence relative speed} &= |v_1 - v_2| = |v_2 - v_1| \\ &= |58 \cdot 8 - (-39 \cdot 2)| = 98 m/s \end{aligned}$$

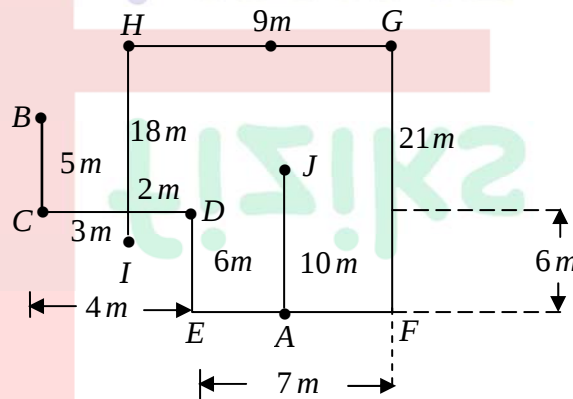

Ans. 19: (c)

Solution: All Dictionaries are books but no Book is a Printer. Similarly no Dictionaries is a printer.

Ans. 20: (d)

Solution: The situation of the problem is shown below in the figure. Hence the distance DI is

$$\sqrt{2^2 + 3^2} = \sqrt{4 + 9} = \sqrt{13}m$$

Ans. 21: (d)

Solution: $\because E_1^{\parallel} = E_2^{\parallel}$ and $D_1^{\perp} = D_2^{\perp} \Rightarrow \epsilon_1 E_1^{\perp} = \epsilon_2 E_2^{\perp} \Rightarrow \frac{E_1^{\perp}}{E_2^{\perp}} = \frac{\epsilon_2}{\epsilon_1}$

$$\Rightarrow E_2^{\perp} > E_1^{\perp} \Rightarrow |\vec{E}_2| > |\vec{E}_1| \quad \because \epsilon_1 > \epsilon_2$$

$$\because D_1^{\perp} = D_2^{\perp} \text{ and } D_1^{\parallel} = \epsilon_1 E_1^{\parallel}, D_2^{\parallel} = \epsilon_2 E_2^{\parallel} \Rightarrow \frac{D_1^{\parallel}}{D_2^{\parallel}} = \frac{\epsilon_1}{\epsilon_2}$$

$$\Rightarrow D_2^{\parallel} < D_1^{\parallel} \Rightarrow |\vec{D}_2| < |\vec{D}_1| \quad \because \epsilon_1 > \epsilon_2$$

Ans. 22: (c)

Solution: $z = \sum \exp(-E_n / kT) \Rightarrow \langle E \rangle = \frac{1}{z} \sum E_n e^{-E_n / kT}$

$$C_v = \left. \frac{\partial \langle E \rangle}{\partial T} \right|_{N,V} = - \frac{\partial \ln z}{\partial T} \langle E \rangle + \frac{1}{kT^2} \langle E^2 \rangle$$

$$\text{Thus, } C_v = \frac{1}{kT^2} (\langle E^2 \rangle - \langle E \rangle^2) \Rightarrow C_v = \frac{1}{kT^2} (\Delta E)^2$$

Ans. 23: (a)

Solution: $\frac{dy}{dx} = \frac{y^2}{x} \Rightarrow \frac{dy}{y^2} = \frac{dx}{x} \Rightarrow -\frac{1}{y} = \ln x + C'$

$$y(1) = 1 \Rightarrow -\frac{1}{1} = \ln 1 + C' \Rightarrow C' = -1 \Rightarrow -\frac{1}{y} = \ln x - 1 \Rightarrow y = \frac{1}{1 - \ln x} \text{ as } x \rightarrow 0, y \text{ blows up}$$

Ans. 24: (b)

Solution: If $A = (p_x - bx)$ is conserved then Poisson bracket $[p_x - bx, H] = 0$

$$\text{and } [p_x - bx, H] = (p_x + ax)(-b - a) = 0 \Rightarrow b = -a$$

Ans. 25: (a)

Solution: $B_1 \times 2\pi \frac{a}{2} = \mu_0 \frac{i}{\pi a^2} \left(\frac{\pi a^2}{4} \right) \Rightarrow B_1 = \frac{\mu_0 i}{4\pi a} \dots (i)$

$$B_2 \times 2\pi (2a) = \mu_0 i \Rightarrow B_2 = \frac{\mu_0 i}{4\pi a} \dots (ii)$$

$$\text{Thus } \frac{B_1}{B_2} = 1$$

Ans. 26: (b)

Solution: $\psi(r, \theta, \phi) = \frac{1}{\sqrt{8\pi a^3}} e^{-r/a}$

$$\langle r^2 \rangle = \iiint \psi^* \psi r^4 dr \sin \theta d\theta d\phi = \frac{1}{8\pi a^3} \int_0^\infty \int_0^\pi \int_0^{2\pi} e^{-r/a} r^4 \sin \theta dr d\theta d\phi = \frac{1}{8\pi a^3} \cdot 4\pi \int_0^\infty e^{-r/a} r^4 dr$$

$$= 3(2a)^2 = 12a^2$$

one can compare the wave function of hydrogen atom with Bohr radius $a_0 = 2a$
most probable distance,

$$\frac{d}{dr} r^2 e^{-r/a} = 0, r_p = 2a, \frac{r_p^2}{\langle r^2 \rangle} = \frac{(2a)^2}{12a^2} = \frac{1}{3}$$

Ans. 27: (c)

Solution: $I = \oint_C \frac{\sin z}{2z - \pi} dz$ pole $\Rightarrow 2z - \pi = 0 \Rightarrow z = \frac{\pi}{2}$

Residue at $z = \frac{\pi}{2} \because |z| = 2$ so it will be lies within the contour

$$I_{(emg)} = \oint_C \frac{e^{iz}}{2\left(z - \frac{\pi}{2}\right)} dz = \sum R \times 2\pi i$$

$$\text{Res} \left|_{z=\frac{\pi}{2}} \right. = \frac{\left(z - \frac{\pi}{2}\right) e^{iz}}{2\left(z - \frac{\pi}{2}\right)} = \frac{e^{i\pi/2}}{2} = \frac{i}{2} \text{ (taking imaginary part); Residue} = \frac{1}{2}$$

$$\text{Now } I = \frac{1}{2} \times 2\pi i = \pi i$$

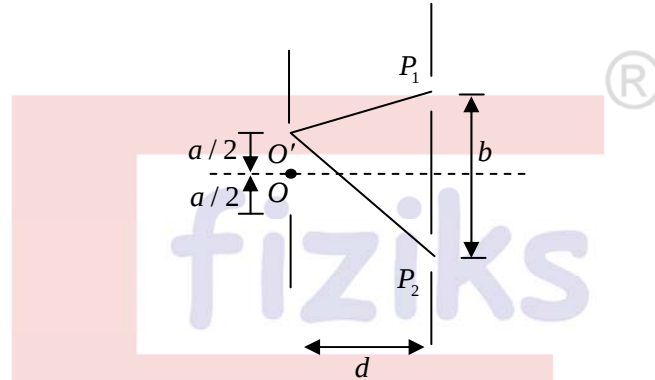

Ans. 28: (b)

Solution: $\frac{dS}{dt} = \sum_{\alpha} \vec{p}_{\alpha} \cdot \vec{r}_{\alpha} + \vec{p}_{\alpha} \cdot \vec{r}_{\alpha} \quad \left\langle \frac{dS}{dt} \right\rangle = \frac{1}{\tau} \int_0^{\tau} \frac{dS}{dt} dt = \frac{S(\tau) - S(0)}{\tau} = 0$

$$\left\langle \sum_{\alpha} \vec{p}_{\alpha} \cdot \vec{r}_{\alpha} \right\rangle = - \left\langle \sum_{\alpha} \vec{p}_{\alpha} \cdot \vec{r}_{\alpha} \right\rangle \Rightarrow 2 \langle T \rangle = - \left\langle \sum_{\alpha} \vec{F}_{\alpha} \cdot \vec{r}_{\alpha} \right\rangle$$

Ans. 29: (d)

Solution:

If the path difference $O'P_2 - O'P_1 = \frac{\lambda}{2}$

The minima of the interference pattern produced by O will fall on the maxima produced by O'

Now $O'P_2 = \left[d^2 + \left(\frac{b}{2} + \frac{a}{2} \right)^2 \right]^{1/2} \approx d + \frac{1}{2d} \left(\frac{b}{2} + \frac{a}{2} \right)^2$

$O'P_1 = \left[d^2 + \left(\frac{b}{2} - \frac{a}{2} \right)^2 \right]^{1/2} \approx d + \frac{1}{2d} \left(\frac{b}{2} - \frac{a}{2} \right)^2$

$\Rightarrow O'P_2 - O'P_1 \approx \frac{ab}{2d} \quad (\because d \gg b, a)$

Thus $\frac{\lambda}{2} = \frac{ab}{2d} \Rightarrow d = \frac{ab}{\lambda}$

Ans. 30: (a)

Solution:

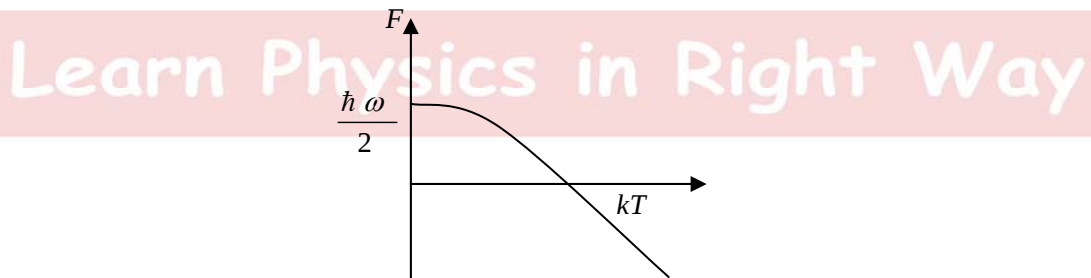

Figure: Plot of F verses

$$F = \frac{N\hbar\omega}{2} + NkT \ln(1 - e^{-\hbar\omega/kT})$$

Case 1: Now, if $kT \rightarrow 0 \Rightarrow e^{-\hbar\omega/kT} \rightarrow 0 \Rightarrow F \rightarrow \frac{N\hbar\omega}{2}$

Ans. 31: (a)

Solution: $\frac{dL_z}{dt} = \frac{1}{i\hbar} [L_z, H] = \frac{1}{i\hbar} [L_z, c\vec{\alpha} \cdot \vec{p} + \beta mc^2]$

$$i\hbar \frac{dL_z}{dt} = c [xp_y, \alpha_x p_x] - c [yp_x, \alpha_y p_y] = \frac{i\hbar c}{i\hbar} [p_y \alpha_x - p_x \alpha_y] = c [p_y \alpha_x - p_x \alpha_y]$$

Ans. 32: (b)

Solution: $y = E_0 \sin(2\pi f_0 t)$.

The Fourier transform is:

$$F(y) = \frac{E_0}{2} [\delta(f + f_0)] - \delta[f - f_0]$$

In Fourier space $\bar{f} = f_0$, $\bar{A} = \frac{E_0}{2}$.

Ans. 33: (c)

Solution: $\omega^2 = \beta k + \alpha k^3$

$$2\omega \frac{d\omega}{dk} = \beta + 3\alpha k^2 \Rightarrow \frac{d\omega}{dk} = \frac{\beta + 3\alpha k^2}{2\omega} \quad (1)$$

also $\omega \cdot \frac{\omega}{k} = \beta + \alpha k^2 \quad (2)$

divide (1) and (2)

$$\frac{d\omega/dk}{\omega(\omega/k)} = \frac{\beta + 3\alpha k^2}{2\omega} \times \frac{1}{\beta + \alpha k^2}$$

$$\therefore \frac{d\omega}{dk} = \frac{\omega}{k}$$

$$\Rightarrow 2(\beta + \alpha k^2) = \beta + 3\alpha k^2 \Rightarrow \beta = \alpha k^2 \Rightarrow k = \sqrt{\frac{\beta}{\alpha}}$$

Ans. 34: (b)

Solution: $E'_x = 0, E'_y = 0, E'_z = \frac{\sigma}{\epsilon_0}$ and $B'_x = 0, B'_y = 0, B'_z = 0$

$$E_x = E'_x = 0, E_y = \gamma(E'_z + vB'_z) = \gamma \frac{\sigma}{\epsilon_0}, E_z = \gamma(E'_z - vB'_y) = \frac{\gamma\sigma}{\epsilon_0}$$

$$B_x = B'_x, B_y = \gamma\left(B'_y - \frac{vE'_z}{c^2}\right) = -\frac{\gamma v \sigma}{\epsilon_0 c^2}, B_z = \gamma\left(B'_z - \frac{vE'_y}{c^2}\right) = 0$$

Ans. 35: (c)

$$\text{Solution: } E_2^1 = \int_0^{a/4} H_p \phi_2^* \phi_2 dx$$

$$\Delta V = \int_0^{a/4} V_0 \frac{2}{a} \sin^2 \left(\frac{2\pi x}{a} \right) dx = \frac{2}{a} V_0 \int_0^{a/4} \frac{1}{2} \left[1 - \cos \frac{4\pi x}{a} \right] dx$$

$$= \frac{2}{a} V_0 \left[\frac{x}{1} - \frac{\sin \frac{4\pi x}{a}}{\frac{4\pi}{a}} \right]_0^{a/4} = V_0 \left[\frac{1}{4} \right] = 0.25 V_0$$

Ans. 36: (a)

$$\text{Solution: } p = \frac{\partial F}{\partial q} = \omega q \cot 2\pi Q \dots\dots\dots(1)$$

$$P = -\frac{\partial F}{\partial Q} = \omega q^2 \pi \operatorname{cosec}^2 2\pi Q$$

$$\text{Put } q = \sqrt{\frac{P}{\pi \omega}} \cdot \frac{1}{\operatorname{cosec} 2\pi Q} = \sqrt{\frac{P}{\pi \omega}} \sin 2\pi Q \text{ in equation (1) one will get}$$

$$p = \omega \sqrt{\frac{P}{\pi \omega}} \cdot \frac{\cot 2\pi Q}{\operatorname{cosec} 2\pi Q} = \sqrt{\frac{\omega P}{\pi}} \cdot \cos 2\pi Q \Rightarrow \frac{q}{p} = \frac{1}{\omega} \tan 2\pi Q$$

Ans. 37: (a)

Solution: It is voltage doublers circuit in which C_1 will be charged to maximum value input that is $1V$.

So $v(t) = (\cos \omega t - 1)$ according to KVL.

Ans. 38: (b)

$$\text{Solution: } \tan(ka + \delta_0) = \left[\frac{1}{\tan(ka)} + \frac{2mV_0}{k\hbar^2} \right]^{-1}$$

If the incident particles have small velocities, $ka \ll 1$, we have $\tan(ka) \approx ka$ and $\tan(ka + \delta_0) \approx \tan(\delta_0)$.

$$\tan \delta_0 \approx \frac{ka}{1 + 2mV_0 a / \hbar^2} \Rightarrow \sin^2 \delta_0 = \frac{1}{1 + \frac{1}{\tan^2 \delta_0}} \approx \frac{k^2 a^2}{k^2 a^2 + (1 + 2mV_0 a / \hbar^2)^2}$$

$$\sigma_0 = \frac{4\pi}{k^2} \sin^2 \delta_0 = \frac{4\pi a^2}{k^2 a^2 + (1 + 2mV_0 a / \hbar^2)^2}$$

Ans. 39: (c)

Solution: $\tilde{f}(k) = \int_{-\infty}^{\infty} dx e^{ikx} (\alpha\delta(x) + \beta\delta'(x) + \gamma\delta''(x))$

$$\int_{-\infty}^{\infty} \alpha\delta(x) e^{ikx} dx = \alpha \Rightarrow \int_{-\infty}^{\infty} \beta\delta'(x) e^{ikx} dx = \beta \left[e^{ikx} \delta(x) \Big|_{-\infty}^{\infty} - \int_{-\infty}^{\infty} ike^{ikx} \delta(x) dx \right] = -i\beta k$$

$$\int_{-\infty}^{\infty} \gamma\delta''(x) e^{ikx} dx = -\gamma k^2$$

Ans. 40: (d)

Solution: $Z = \left(\frac{2\pi mkT}{h^2} \right)^{3N/2} \frac{V^N}{N!}$ and $U = \frac{3NkT}{2} \Rightarrow kT = \frac{2}{3} \frac{U}{N}$ [®]

$$Z = \left(\frac{4\pi mU}{3h^2 N} \right)^{3N/2} \frac{V^N}{N!}$$

Ans. 41: (a)

Solution: $e^A B e^{-A} = B + [A, B] + \frac{1}{2!} [A, [A, B]] + \frac{1}{3!} [A, [A, [A, B]]] + \dots$

$$A(t) = \exp\left(\frac{itH}{\hbar}\right) A \exp\left(-\frac{itH}{\hbar}\right) = X + \frac{it}{\hbar} [H, X] + \frac{1}{2!} [H, [H, X]] + \dots$$

$$= X + \frac{t}{m} P - \frac{(\omega t)^2}{2!} X - \frac{(\omega t)^3}{3!} \frac{1}{m\omega} P + \frac{(\omega t)^4}{4!} X + \frac{(\omega t)^5}{5!} \frac{1}{m\omega} P$$

$$X(t) = X \left[1 - \frac{(\omega t)^2}{2!} + \frac{(\omega t)^4}{4!} + \dots \right] + \frac{1}{m\omega} P \left[(\omega t) - \frac{(\omega t)^3}{3!} + \frac{(\omega t)^5}{5!} \dots \right]$$

$$X(t) = X \cos \omega t + \frac{1}{m\omega} P \sin \omega t$$

Ans. 42: (b)

Solution: $I_E = I_C + I_B = (\beta + 1) I_B$

KVL in input loop gives,

$$\therefore I_B = \frac{V_{CC} - V_{BE}}{R_B + (\beta + 1) R_E} = \frac{20 - 0.7}{430K + 51 \times 1K} \Rightarrow I_B = 40 \mu A$$

$$I_C = \beta I_B = 50 \times 40 \mu A = 2000 \mu A = 2mA$$

$$V_C = V_{CC} - I_C R_C = 20 - 2mA \times 2K \Rightarrow V_C = 16V$$

Ans. 43: (c)

Solution: $V_{eff} = \frac{J^2}{2mr^2} - \frac{k}{r^n}, \quad \frac{\partial V_{eff}}{\partial r} = -\frac{J^2}{mr^3} + \frac{nk}{r^{n+1}} = 0$

$$\therefore J = mr^2 \omega \Rightarrow \frac{m^2 \omega^2 r^4}{mr^3} = \frac{nk}{r^{n+1}} \Rightarrow \omega^2 \propto \frac{1}{r^{n+2}} \Rightarrow \omega \propto r^{-(n+2)/2} \Rightarrow T \propto r^{\frac{n}{2}+1}$$

$$\frac{T_2}{T_1} = \left(\frac{2R}{R} \right)^{\frac{n+2}{2}} = 2^{\frac{n}{2}+1}$$

Ans. 44: (c)

Solution: $\frac{dx}{dt} = 2\sqrt{1-x^2} \Rightarrow \frac{dx}{\sqrt{1-x^2}} = 2dt$ $\sin^{-1} x = 2t + c$

$x = 0, t = 0$ so, $c = 0$

$x = \sin 2t$ (x should not be greater than 1 at $x = 1$)

$1 = \sin 2t$ $\sin \frac{\pi}{2} = \sin 2t, t = \frac{\pi}{4}$

so, $x = \sin 2t$ $0 \leq t < \frac{\pi}{4}$

$= 1$ $t \geq \frac{\pi}{4}$

Ans. 45: (d)

Solution: $T = \frac{1}{f} = \frac{1}{500\text{Hz}} = 2\text{ms}$

$I = \frac{CdV}{dt} = 2 \times 10^{-6} \times \frac{3}{2 \times 10^{-3}} = 30 \times 10^{-3} \Rightarrow I = 3\text{mA}$

Ans. 46: (a)

Solution: $d = \frac{1}{\kappa} = \frac{\lambda_0}{4\pi}, \frac{\epsilon_I}{\epsilon_R} = \sqrt{3} = \frac{\sigma}{\omega \epsilon}$

$\kappa = \omega \sqrt{\frac{\epsilon \mu}{2}} \left[\sqrt{1 + \left(\frac{\sigma}{\omega \epsilon} \right)^2} - 1 \right]^{1/2} \Rightarrow \kappa = \omega \sqrt{\frac{\epsilon \mu}{2}} = \frac{2\pi}{\lambda_0} \Rightarrow \sqrt{\epsilon \mu} = \frac{\sqrt{2}}{\omega} \frac{2\pi}{\lambda_0}$

$K = \sqrt{k^2 + \kappa^2} = \omega \left[\epsilon \mu \sqrt{1 + \left(\frac{\sigma}{\omega \epsilon} \right)^2} \right]^{1/2}$

$\frac{E_0}{B_0} = \frac{\omega}{K} = \frac{\omega}{\omega \left[\epsilon \mu \sqrt{1 + \left(\frac{\sigma}{\omega \epsilon} \right)^2} \right]^{1/2}} = \frac{1}{\sqrt{2 \epsilon \mu}} = \frac{1}{\sqrt{2} \times \frac{\sqrt{2}}{\omega} \times \frac{2\pi}{\lambda_0}} = \frac{\lambda_0 \omega}{4\pi} = \frac{\lambda_0 \times 2\pi c / \lambda_0}{4\pi} = \frac{c}{2}$

Ans. 47: (c)

Solution: For one particle $\langle \mu \rangle = (\mu_0) p + (-\mu_0)(1-p) = \mu_0(2p-1) = \mu_0 \left(2 \cdot \frac{2}{3} - 1 \right) = \frac{\mu_0}{3}$ Where

$p = \frac{2}{3}$

$\langle \mu_1^2 \rangle = (\mu_0)^2 p + (-\mu_0)^2 (1-p) = \mu_0^2$

$$(\Delta\mu)^2 = \langle \mu^2 \rangle - \langle \mu \rangle^2 = \mu_0^2 - \mu_0^2 (2p-1)^2 = 4\mu_0^2 p(1-p),$$

$$\langle \Delta\mu \rangle = 2\mu_0 \sqrt{p(1-p)} = 2\mu_0 \sqrt{\frac{2}{3} \left(1 - \frac{2}{3}\right)} = \frac{2\sqrt{2}}{3} \mu_0$$

$$\frac{\langle \Delta\mu \rangle}{\langle \mu \rangle} = \frac{\frac{2\sqrt{2}\mu_0}{3}}{\frac{\mu_0}{3}} = 2\sqrt{2}$$

Ans. 48: (d)

Solution: Let Fourier series is $f(x) = \sum_{n=-\infty}^{\infty} c_n e^{inx}$

$$\therefore c_n = \frac{1}{2\pi} \int_{-\pi}^{\pi} f(x) e^{-inx} dx$$

$$\Rightarrow c_n = \frac{1}{2\pi} \int_{-\pi}^{\pi} e^x e^{-inx} dx = \frac{1}{2\pi} \int_{-\pi}^{\pi} e^{(1-in)x} dx = \frac{1}{2\pi} \frac{1}{(1-in)} \left[e^{(1-in)x} \right]_{-\pi}^{\pi} = \frac{1}{2\pi} \frac{1}{(1-in)} \left[e^{(1-in)\pi} - e^{-(1-in)\pi} \right]$$

$$\Rightarrow c_n = \frac{1}{2\pi} \frac{1}{(1-in)} \left[e^{\pi} e^{-in\pi} - e^{-\pi} e^{in\pi} \right] = \frac{1}{2\pi} \left(\frac{1+in}{1+n^2} \right) \left[e^{\pi} - e^{-\pi} \right] (-1)^n \quad \because e^{\pm in\pi} = (-1)^n$$

$$\Rightarrow c_n = \left(\frac{1+in}{1+n^2} \right) \frac{\sinh \pi}{\pi} (-1)^n \quad \because \sinh \pi = \frac{e^{\pi} - e^{-\pi}}{2}$$

$$\text{Thus Fourier series is } f(x) = \frac{\sinh \pi}{\pi} \sum_{n=-\infty}^{\infty} (-1)^n \left(\frac{1+in}{1+n^2} \right) e^{inx} \dots\dots\dots(1)$$

Let us derive the real Fourier series

$$\therefore (1+in)e^{inx} = (1+in)(\cos nx + i \sin nx) = (\cos nx - n \sin nx) + i(\cos nx + \sin nx)$$

$\therefore n$ varies from $-\infty$ to $+\infty$, equation (1) has corresponding term with $-n$ instead of n .

Thus

$$\therefore (1-in)e^{-inx} = (1-in)(\cos nx - i \sin nx) = (\cos nx - n \sin nx) - i(\cos nx + \sin nx)$$

Let's add these two expressions;

$$(1+in)e^{inx} + (1-in)e^{-inx} = 2(\cos nx - n \sin nx), \quad n = 1, 2, 3, \dots$$

$$\text{For } n = 0, \quad (-1)^n \left(\frac{1+in}{1+n^2} \right) e^{inx} = 1$$

$$\text{Thus, } f(x) = \frac{\sinh \pi}{\pi} + 2 \frac{\sinh \pi}{\pi} \sum_{n=1}^{\infty} (-1)^n \frac{(\cos nx - n \sin nx)}{1+n^2}$$

$$f(x) = \frac{2\sinh \pi}{\pi} \left[\frac{1}{2} - \frac{1}{1+1^2} (\cos x - \sin x) + \frac{1}{1+2^2} (\cos 2x - 2 \sin 2x) - \dots \right]$$

Ans. 49: (c)

Solution: $L = \frac{1}{2} M \dot{x}^2 + \frac{1}{2} m (\dot{x}^2 + \ell^2 \dot{\theta}^2 + 2\ell \dot{x} \dot{\theta} \cos \theta) + mg\ell \cos \theta.$

The equations of motion obtained from varying x and θ are

$$(M + m) \ddot{x} + m\ell \ddot{\theta} \cos \theta - m\ell \dot{\theta}^2 \sin \theta = 0,$$

$$\ell \ddot{\theta} + \ddot{x} \cos \theta + g \sin \theta = 0.$$

If θ is small, we can use the small – angle approximations, $\cos \theta \approx 1 - \theta^2/2$ and $\sin \theta \approx \theta$.

Keeping only the terms that are first – order in θ , we obtain

$$(M + m) \ddot{x} + m\ell \ddot{\theta} = 0,$$

$$\ddot{x} + \ell \ddot{\theta} + g\theta = 0.$$

The first equation expresses momentum conservation. Integrating it twice gives

$$x = -\left(\frac{m\ell}{M + m}\right)\theta + At + B$$

The second equation is $F = ma$ in the tangential direction. Eliminating $\ddot{x}$ gives

$$\ddot{\theta} + \left(\frac{M + m}{M}\right)\frac{g}{\ell}\theta = 0.$$

Ans. 50: (a)

Solution: For constant potential transition probability

$$p_{if}(i) = 4 \frac{|\langle \psi_f | V | \psi_i \rangle|^2}{h^2 \omega_{fi}^2} \left(\sin^2 \frac{\omega_{fi} t_i}{2} \right)$$

at $t_f = \frac{t_i}{2},$

$$p_{if} = \frac{4 |\langle \psi_f | V | \psi_i \rangle|^2}{h^2 \omega_{fi}^2} \sin^2 \frac{\omega_{fi} (t_f)}{2}$$

$$p_{if}(f) = \frac{4 |\langle \psi_f | V | \psi_i \rangle|^2}{h^2 \omega_{fi}^2} \sin^2 \left(\frac{\omega_{fi} t_i}{4} \right)$$

$$\frac{p_{if}(f)}{p_{if}(i)} = \frac{\sin^2 \left(\frac{\omega_{fi} t_i}{4} \right) \frac{\omega_{fi}^2 t_i^2}{4^2}}{\sin^2 \left(\frac{\omega_{fi} t_i}{2} \right) \frac{\omega_{fi}^2 t_i^2}{4}} \quad t_i \rightarrow 0$$

$$= \frac{4 \omega_{fi}^2 t_i^2}{16 \omega_{fi}^2 t_i^2} = \frac{1}{4} \Rightarrow \frac{p_{if}(f)}{p_{if}(i)} = \frac{1}{4}$$

Ans. 51: (c)

Solution: $\phi_B = \int_s \vec{B} \cdot d\vec{a} = \int_r^w \frac{\mu_0 I}{2\pi r} L dr = \frac{\mu_0 IL}{2\pi R} \ln\left(\frac{r+w}{r}\right)$

$$\Rightarrow I = -\frac{1}{R} \frac{d\phi_B}{dt} = \frac{\mu_0 IL}{2\pi R} \left[\frac{1}{r+w} - \frac{1}{r} \right] \frac{dr}{dt} = \frac{\mu_0 ILwv}{2\pi Rr(r+w)}$$

Ans. 52: (a)

Solution: $E = E_0 + A(Ka) + B(Ka)^2 + C(Ka)^3 + D(Ka)^4$

$$\therefore \frac{\partial E}{\partial K} = Aa + 2Ba^2K + 3Ca^3K^2 + 4Da^4K^3$$

and $\frac{\partial^2 E}{\partial K^2} = 2Ba^2 + 6Ca^3K + 12Da^4K^2$

At the bottom of the conduction band, $K = 0$

$$\therefore \frac{\partial^2 E}{\partial K^2} = 2Ba^2$$

$$m^* = \frac{\hbar^2}{\partial^2 E / \partial K^2} = \frac{\hbar^2}{2Ba^2} = \frac{(1.05 \times 10^{-34})^2}{2 \times 6.4 \times 10^{-19} \times (3.2 \times 10^{-10})^2}$$

$$= 8.4 \times 10^{-32} \text{ kg}$$

$$\therefore \frac{m^*}{m} = \frac{8.4 \times 10^{-32}}{9.1 \times 10^{-31}} = 0.092 \approx 0.1$$

Ans. 53: (d)

Solution: $\frac{dN_2}{dt} = W - \frac{N_2}{\tau_{21}}$ and $\frac{dN_1}{dt} = \frac{N_2}{\tau_{21}} - \frac{N_1}{\tau_1}$

In equilibrium condition $\frac{dN_2}{dt} = \frac{dN_1}{dt} = 0$

$$\Rightarrow N_2 = \tau_{21}W = 10^{22} \times 9 \times 10^{-9} = 9 \times 10^{13} \text{ cm}^{-3}$$

$$N_1 = \frac{\tau_1 N_2}{\tau_{21}} = \frac{3 \times 10^{-3} \times 9 \times 10^{13}}{9 \times 10^{-9}} = 3 \times 10^{19} \text{ cm}^{-3}$$

Ans. 54: (b)

Solution: $p_1 = \frac{1}{2}$, $p_2 = \frac{1}{3}$ so $p_3 = 1 - \left(\frac{1}{2} + \frac{1}{3}\right) = \frac{1}{6}$

$$P_1 = \frac{1}{2}, P_2 = 1/3 \text{ and } P_3 = 1/6.$$

$$S = -k_B \left(\frac{1}{2} \ln 1/2 + \frac{1}{3} \ln 1/3 + \frac{1}{6} \ln 1/6 \right).$$

$$S = -k_B \left(\frac{1}{2} (\ln 1 - \ln 2) + \frac{1}{3} (\ln 1 - \ln 3) + \frac{1}{6} (\ln 1 - \ln 6) \right)$$

$$S = k_B \left[\frac{1}{2} \ln 2 + \frac{1}{3} \ln 3 + \frac{1}{6} \ln 2 + \frac{1}{6} \ln 3 \right]$$

$$S = k_B \left[\frac{1}{2} \ln 2 + \frac{1}{6} \ln 2 + \frac{1}{3} \ln 3 + \frac{1}{6} \ln 3 \right]$$

$$= k_B \left[\frac{3 \ln 2 + \ln 2}{6} + \frac{2 \ln 3 + \ln 3}{6} \right] = k_B \left(\frac{4 \ln 2}{6} + \frac{3 \ln 3}{6} \right)$$

$$S = k_B \left[\frac{2}{3} \ln 2 + \frac{1}{2} \ln 3 \right]$$

Ans. 55: (a)

Solution: Our task is to find $u(x, t)$. The general solution of one dimensional wave equation is

given by $u(x, t) = \sum_{n=1}^{\infty} (B_n \cos \lambda_n t + B_n^* \sin \lambda_n t) \sin \frac{n\pi}{L} x$ where B_n 's and B_n^* 's are unknowns to be

determined and $\lambda_n = \frac{cn\pi}{L}$.

In this problem the initial velocity $u_t(x, 0)$ is zero, hence all the B_n^* 's are zero.

B_n 's are the Fourier sine series coefficients of $u(x, 0)$.

$$\begin{aligned} B_n &= \frac{2}{L} \int_0^L f(x) \sin \frac{n\pi x}{L} dx, = \frac{2}{1} \int_0^1 k[x(1-x)] \sin n\pi x dx \\ &= 2k \int_0^1 (x - x^2) \sin n\pi x dx \end{aligned}$$

Let us evaluate the two integrals separately

$$\int_0^1 x \sin n\pi x dx = \left\{ \frac{-x \cos n\pi x}{n\pi} \right\}_0^1 + \frac{1}{n\pi} \int_0^1 \cos n\pi x dx = \frac{-(-1)^n}{n\pi}$$

$$\begin{aligned} \int_0^1 x^2 \sin n\pi x dx &= \left\{ \frac{-x^2 \cos n\pi x}{n\pi} \right\}_0^1 - \int_0^1 2x \left[\frac{-\cos n\pi x}{n\pi} \right] dx \\ &= \frac{-(-1)^n}{n\pi} + \frac{2}{n\pi} \int_0^1 x \cos n\pi x dx \end{aligned}$$

$$= -\frac{(-1)^n}{n\pi} + \frac{2}{n\pi} \left[\frac{x \sin n\pi x}{n\pi} + \frac{1}{n^2 \pi^2} \cos n\pi x \right]_0^1$$

$$= -\frac{(-1)^n}{n\pi} + \frac{2}{n\pi} \cdot \frac{1}{n^2 \pi^2} (\cos n\pi - 1) = -\frac{(-1)^n}{n\pi} + \frac{2}{n^3 \pi^3} (\cos n\pi - 1)$$

Hence,
$$\int_0^1 (x - x^2) \sin n\pi x = \frac{-1(-1)^n}{n\pi} + \frac{(-1)^n}{n\pi} - \frac{2}{n^3 \pi^3} (\cos n\pi - 1)$$

Thus,
$$B_n = 2k \left(\frac{-2}{n^3 \pi^3} \right) (\cos n\pi - 1)$$

For even n , $B_n = 0$

For odd n , $B_n = \frac{8k}{n^3 \pi^3}$

Hence the required solution is

$$u(x, t) = \sum_{n=1}^{\infty} \frac{8k}{n^3 \pi^3} \cos n\pi t \cdot \sin n\pi x = \frac{8k}{\pi^3} \sum_{n=1}^{\infty} \frac{1}{n^3} \cos n\pi t \sin n\pi x, \quad n \text{ odd.}$$

In the expanded form the solution can be written as

$$u(x, t) = \frac{8k}{\pi^3} \left(\cos \pi t \sin \pi x + \frac{1}{27} \cos 3\pi t \sin 3\pi x + \frac{1}{125} \cos 5\pi t \sin 5\pi x + \dots \right)$$

Ans. 56: (c)

Solution: Guided velocity $v_g = c \sqrt{1 - \left(\frac{f_c}{f} \right)^2} = 3 \times 10^8 \sqrt{1 - \left(\frac{6.5}{7.2} \right)^2} = 1.29 \times 10^8 \text{ ms}$

$$\Rightarrow t = \frac{2l}{v_g} = \frac{2 \times 150}{1.29 \times 10^8} = 232 \text{ ns.}$$

Ans. 57: (c)

Solution: Take the angle θ between the thin tube and fixed horizontal line through the pivot and the distance r of the centre of mass of the thin rod from the pivot of the tube, as shown in figure, as the generalized coordinates. We have

$$T = \frac{1}{2} M (\dot{r}^2 + r^2 \dot{\theta}^2) + \frac{1}{24} M I^2 \dot{\theta}^2, \quad V = 0$$

and the Lagrangian
$$L = \frac{1}{2} M (\dot{r}^2 + r^2 \dot{\theta}^2) + \frac{1}{24} M I^2 \dot{\theta}^2$$

$$p_\theta = \frac{\partial L}{\partial \dot{\theta}} = M r^2 \dot{\theta} + \frac{M I^2 \dot{\theta}}{12}, \quad \dot{\theta} = \omega$$

$$p_\theta = M r^2 \omega + \frac{M I^2 \omega}{12}$$

Ans. 58: (c)

Solution: Case I: Four steps in x - axis

Two steps in $+x$ and two steps in $-x$

$$\therefore \text{probability} = {}^4c_2 \times \left(\frac{1}{4}\right)^2 \left(\frac{1}{4}\right)^2 = \frac{6}{4^4}$$

Case II: Four steps in y - axis

Two steps in $+y$ and two steps in $-y$

$$\therefore \text{probability} = {}^4c_1 \times {}^2c_1 \left(\frac{1}{4}\right)^2 \left(\frac{1}{4}\right)^2 = \frac{6}{4^4}$$

Case 3: Two steps in $+x$ and two steps in $-y$ axis

$\Rightarrow$ One step in each $+x, -x, +y$ & $-y$

$$\therefore \text{probability} = {}^2c_1 \times {}^2c_2 \left(\frac{1}{4}\right)^4 = \frac{4}{4^4}$$

$$\therefore \text{Answer} = \frac{16}{4^4} = \frac{1}{16}$$

Ans. 59: (c)

Solution: $V(r) = kr^2$, Trial wave function, $\psi = e^{-ar^2}$

$$\text{Normalising, } \psi, |A|^2 4\pi \int_0^\infty e^{-2ar^2} r^2 dr = 1 \Rightarrow 4\pi |A|^2 \frac{1}{2} \left(\frac{1}{2a}\right)^{3/2} \frac{\sqrt{\pi}}{2} = 1 \Rightarrow |A| = \left(\frac{2a}{\pi}\right)^{3/4}$$

$$\therefore \psi = \left(\frac{2a}{\pi}\right)^{3/4} e^{-ar^2}$$

$$\langle T \rangle = -\frac{\hbar^2}{2m} 4\pi \int_0^\infty \left(\frac{2a}{\pi}\right)^{3/2} e^{-ar^2} \left(\frac{\partial^2}{\partial r^2} + \frac{2}{r} \frac{\partial}{\partial r}\right) (e^{-ar^2}) r^2 dr$$

$$= -\frac{\hbar^2}{2m} \left(\frac{2a}{\pi}\right)^{3/2} 4\pi \int_0^\infty e^{-ar^2} (4a^2 r^2 - 6a) e^{-ar^2} r^2 dr$$

$$= -\frac{2\pi\hbar^2}{m} \left(\frac{2a}{\pi}\right)^{3/2} \left[\int_0^\infty 4a^2 r^4 e^{-2ar^2} dr - 6a \int_0^\infty r^2 e^{-2ar^2} dr \right]$$

$$= -\frac{2\pi\hbar^2}{m} \left(\frac{2a}{\pi}\right)^{3/2} \left[4a^2 \frac{1}{2} \left(\frac{1}{2a}\right)^{5/2} \frac{3}{4} \sqrt{\pi} - \frac{6a}{2} \left(\frac{1}{2a}\right)^{3/2} \frac{\sqrt{\pi}}{2} \right]$$

$$= -\frac{2\pi\hbar^2}{m} \left(\frac{2a}{\pi}\right)^{3/2} \left[\frac{3}{8} \sqrt{\frac{\pi}{2a}} - \frac{3}{4} \sqrt{\frac{\pi}{2a}} \right] = -\frac{2\pi\hbar^2}{m} \left(\frac{2a}{\pi}\right)^{3/2} \times -\frac{3}{8} \sqrt{\frac{\pi}{2a}} = \frac{2\pi\hbar^2}{m} \times \frac{3}{8} \times \frac{2a}{\pi}$$

$$\langle T \rangle = \frac{3}{2} \frac{\hbar^2 a}{m}$$

$$\text{Now, } \langle V \rangle = 4\pi \left(\frac{2a}{\pi}\right)^{3/2} \int_0^\infty r^2 k r e^{-2ar^2} dr \Rightarrow 4\pi \left(\frac{2a}{\pi}\right)^{3/2} \frac{1}{2} k \frac{1}{(2a)^2} \sqrt{2}$$

$$\langle V \rangle = \frac{2k}{(2\pi)^{1/2} \alpha^{1/2}}$$

$$\langle E \rangle = \langle T \rangle + \langle V \rangle = \frac{3}{2} \frac{\hbar^2 \alpha}{m} + \frac{2k}{(2\pi)^{1/2} \alpha^{1/2}}$$

$$\frac{d\langle E \rangle}{d\alpha} = 0 \Rightarrow \frac{3}{2} \frac{\hbar^2}{m} - \frac{1}{2} \frac{2k}{(2\pi)^{1/2}} \alpha^{-3/2} = 0 \dots\dots\dots(1)$$

$$\alpha^{-3/2} = \frac{3\hbar^2 (2\pi)^{1/2}}{2km} \Rightarrow \alpha^{-1/2} = \left(\frac{3\hbar^2 (2\pi)^{1/2}}{2km} \right)^{1/3}$$

From equation (1) $\frac{3}{2} \frac{\hbar^2 \alpha}{m} = \frac{1}{2} \frac{2k}{(2\pi)^{1/2}} \alpha^{-1/2}$

$$\langle E \rangle = \frac{3}{2} \frac{2k}{(2\pi)^{1/2} \alpha^{1/2}} = \frac{3k}{(2\pi)^{1/2} \alpha^{1/2}} \Rightarrow \frac{3k}{(2\pi)^{1/2}} \cdot \left[\left(\frac{3\hbar^2 (2\pi)^{1/2}}{2km} \right)^{1/3} \right] = 3 \left(\frac{9k^4 \hbar^4}{16\pi^2 m^2} \right)^{1/6}$$

Ans. 60: (c)

Solution: Heat capacity is defined as $C_V = AT + BT^3$

where $A = \frac{3}{2} Nk_B \frac{1}{E_F}$ and $B = \frac{12\pi^4}{5} Nk_B \frac{1}{\theta_B^3}$

Thus $\frac{A_x}{A_y} = \frac{E_{F_y}}{E_{F_x}} = \frac{6eV}{4eV} = \frac{6}{4} = \frac{3}{2}$

and $\frac{B_x}{B_y} = \frac{\theta_{Dy}^3}{\theta_{Dx}^3} = \left(\frac{320}{180} \right)^3 = (1.7)^3 = 4.8$

Ans. 61: (d)

Solution: The electric field is $\vec{E}(r, t) = -\frac{\partial \vec{A}}{\partial t} = -\frac{\mu_0 I_0 c}{2\pi \sqrt{(ct)^2 - r^2}} \hat{z}$

Ans. 62: (c)

Solution: (i) $\Delta^{++} \rightarrow p + \pi^+$

$$uuu \rightarrow uud + u\bar{d} \Rightarrow uu \rightarrow ud + \bar{d}$$

(ii) $\Sigma^+ \rightarrow n + \pi^+$

$$uus \rightarrow uud + \bar{u}d \Rightarrow ds \rightarrow ud + \bar{d}$$

(iii) $\Sigma^- \rightarrow n + \pi^-$

$$dds \rightarrow udd + \bar{u}d \Rightarrow ds \rightarrow ud + \bar{u}$$

(iv) $\Delta^- \rightarrow n + \pi^-$

$$ddd \rightarrow udd + \bar{u}d \Rightarrow dd \rightarrow ud + \bar{u}$$

Ans. 63: (d)

Solution: $\vec{a}_1 = a\hat{x}$ and $\vec{a}_2 = \frac{a}{2}(x + \sqrt{3}\hat{y})$; assuming $a_3 = \hat{z}$

$$\vec{b}_1 = 2\pi \frac{\vec{a}_2 \times \vec{a}_3}{\vec{a}_1 \cdot (\vec{a}_2 \times \vec{a}_3)} = \frac{2\pi}{a} \left(\hat{x} - \frac{\hat{y}}{\sqrt{3}} \right)$$

$$\vec{b}_2 = 2\pi \frac{\vec{a}_3 \times \vec{a}_4}{\vec{a}_1 \cdot (\vec{a}_2 \times \vec{a}_3)} = \frac{4\pi}{a} \hat{y}$$

$$\text{Area of the first Brillouin zone} = [b_1 \times b_2] = \frac{2\pi}{a} \left(\frac{4\pi}{\sqrt{3}a} \right) = \frac{8\pi^2}{\sqrt{3}a^2}$$

Ans. 64: (b)

Solution:

x	y	xy	x ²
-2	-1	2	4
1	1	1	1
3	2	6	9
$\sum x = 2$	$\sum y = 2$	$\sum xy = 9$	$\sum x^2 = 14$

$$\text{Now, } a = \frac{n\sum xy - \sum x \sum y}{n\sum x^2 - (\sum x)^2} = \frac{3 \times 9 - 2 \times 2}{3 \times 14 - 2^2} = \frac{23}{28} = 0.82$$

$$b = \frac{\sum y - a\sum x}{n} = \frac{2 - \frac{23}{28} \times 2}{3} = \frac{5}{19} = 0.26$$

$$y = ax + b$$

$$y = 0.82x + 0.26$$

Ans. 65: (c)

Solution: $V_o = AV_m \sin \omega t \Rightarrow \frac{dV_o}{dt} = AV_m \omega \cos \omega t$

$$\Rightarrow S.R = \left. \frac{dV}{dt} \right|_{\max} = AV_m \omega = A \cdot 2\pi f V_m$$

$$\therefore 20 \log_{10} A = 40 \Rightarrow A = 100$$

$$\Rightarrow V_m = \frac{S.R}{A \cdot 2\pi f_m} = \frac{1/10^{-6}}{100 \times 2\pi \times 20 \times 10^3} = \frac{1}{4\pi} = 0.0796 \text{ V} \Rightarrow V_m = 79.6 \text{ mV}$$

Ans. 66: (a)

Solution: $\frac{E_6}{E_4} = \frac{J'(J'+1)}{J''(J''+1)} = \frac{6(6+1)}{4(4+1)} = \frac{42}{20} = 2.1$

$$\Rightarrow E_6 = 2.1 \times E_4 = 2.1 \times 148 = 310 \text{ keV}$$

Ans. 67: (a)

Solution: $\frac{dP}{dT} = \frac{L}{T(V_g - V_l)} \approx \frac{L}{TV_g} = \frac{dP}{P} = \frac{(a - bT)dT}{R} = \left(\ln \frac{P}{P_c} \right) = \frac{\left(aT - b \frac{T^2}{2} \right) \frac{T_c}{2}}{R}$

$$\Rightarrow \ln \frac{P}{P_c} = \frac{1}{R} \left(a \left(\frac{T_c}{2} - T_c \right) - b \left(\frac{T_c^2}{8} - \frac{T_c^2}{2} \right) \right)$$

$$\ln \frac{P}{P_c} = \frac{1}{R} \left(a \left(\frac{T_c}{2} - T_c \right) - b \left(\frac{T_c^2}{8} - \frac{T_c^2}{2} \right) \right) \Rightarrow \frac{1}{R} \left(-a \frac{T_c}{2} - \left(-b \frac{3T_c^2}{8} \right) \right)$$

$$\frac{1}{R} \left(\left(b \frac{3T_c^2}{8} \right) - a \frac{T_c}{2} \right)$$

$$P = P_c \exp \left(\frac{1}{R} \left(\left(b \frac{3T_c^2}{8} \right) - a \frac{T_c}{2} \right) \right)$$

Ans. 68: (c)

Solution: Branching ratio $= \frac{\left(\frac{dN}{dt} \right)_A}{\left(\frac{dN}{dt} \right)_\beta} = \frac{(T_{1/2})_A}{(T_{1/2})_\beta} \Rightarrow (T_{1/2}) = \frac{(T_{1/2})}{B.R.} = \frac{100}{0.70}$

$$\Rightarrow (T_{1/2})_\beta = 142.9 \text{ hours}$$

Ans. 69: (c)

Solution: Number of laser modes in the cavity of volume V is

$$N = 8\pi V \frac{\Delta\lambda}{\lambda^4} = 8\pi (2 \times 10^{-2})^3 \times \frac{0.5 \times 10^{-9}}{(6.893 \times 10^{-7})^4} = 4.45 \times 10^{11}$$

Ans. 70: (b)

Solution: $V_0 = \frac{6.6}{0.5} = 13.2 \approx 13$

$$\text{Binary equivalent} = 1101$$

Ans. 71: (a)

Solution: Taking origin at $0.65, h = 0.01$ and $x = 0.6538$

$$\therefore p = \frac{0.6538 - 0.65}{0.01} = 38$$

The difference table is

x	p	$10^7 y$	$10^7 \Delta y$	$10^7 \Delta^2 y$	$10^7 \Delta^3 y$	$10^7 \Delta^4 y$	$10^7 \Delta^5 y$	$10^7 \Delta^6 y$
			76349					
0.63	-2	6270463		-955				
			75394		-4			
0.64	-1	6345857		-959		1		
			74435		-3		1	
0.65	0	6420292		-962		2		-4
			73473		-1		-3	
0.66	1	6493765		-963		-1		
			72510		-2			
0.67	2	6566275		-965				
			71545					
0.68	3	6637820						

Using Gauss's forward interpolation formula

$$\frac{p(p-1)}{2!} \Delta^2 y + \frac{(p+1)p(p-1)}{3!} \Delta^3 y - 1 + \dots$$

$$10^7 y_{0.38} = 6420292 + (0.38)(73473) + \frac{(0.38)(0.38-1)}{2}(-962) + \dots = 6448325$$

$$\therefore y_{0.38} = 0.6448325$$

Ans. 72: (a)

Solution: $\bar{\nu} = 2B(J+1) = 2B(3+1) = 8B_1 = 83.03 \text{ cm}^{-1}$

$$\Rightarrow B_1 = 10.38 \quad [\text{For } {}^1\text{HCl}^{35} \text{ molecule}]$$

$$\text{For } {}^1\text{HCl}^{35} : \mu_1 = \frac{1 \times 35}{1 + 35} \text{ amu} = \frac{35}{36} \text{ amu}$$

$$\text{For } {}^1\text{HCl}^{37} : \mu_2 = \frac{1 \times 37}{1 + 37} \text{ amu} = \frac{37}{38} \text{ amu}$$

$$\text{Since } \frac{B_2}{B_1} = \frac{\mu_1}{\mu_2} \Rightarrow B_2 = \frac{\mu_1}{\mu_2} \times B_1 = \frac{35}{36} \times \frac{38}{37} \times 10.38$$

$$B_2 = 10.36 \text{ cm}^{-1}$$

$$\text{The shift in the spectral line} = 8B_1 - 8B_2 = 8(B_1 - B_2)$$

$$= 8(10.38 - 10.36) = 0.16 \text{ cm}^{-1}$$

Ans. 73: (b)

$$\text{Solution: Probability } |\langle \phi_0 | \phi_1 \rangle|^2, \phi_0 = \sqrt{\frac{2}{L}} \cos \frac{\pi x}{L}, \phi_1 = \sqrt{\frac{2}{2L}} \cos \frac{\pi x}{2L} \quad \text{®}$$

Since the wall of box are moved suddenly then

$$\begin{aligned} \text{Probability} &= \left| \int_{-L/2}^{L/2} \sqrt{\frac{2}{L}} \cdot \sqrt{\frac{1}{L}} \frac{\cos \pi x}{L} \cdot \frac{\cos \pi x}{2L} dx \right|^2 = \left| \frac{\sqrt{2}}{L} \frac{1}{2} \int_{-L/2}^{L/2} \frac{2 \cos \pi x}{L} \cdot \frac{\cos \pi x}{2L} dx \right|^2 \\ &\Rightarrow \left| \frac{\sqrt{2}}{L} \cdot \frac{1}{2} \int_{-L/2}^{L/2} \left[\cos \left(\frac{3\pi x}{2L} \right) + \cos \left(\frac{\pi x}{2L} \right) \right] dx \right|^2 \Rightarrow \left| \frac{\sqrt{2}}{L} \cdot \frac{1}{2} \left[\frac{2L}{3\pi} \sin \frac{3\pi x}{2L} + \frac{2L}{\pi} \sin \frac{\pi x}{2L} \right]_{-L/2}^{L/2} \right|^2 \\ &\Rightarrow \left| \frac{\sqrt{2}}{L} \cdot \frac{1}{2} \left[\frac{2L}{3\pi} \left(\sin \frac{3\pi}{4} + \sin \frac{3\pi}{4} \right) + \frac{2L}{\pi} \left(\sin \frac{\pi}{4} + \sin \frac{\pi}{4} \right) \right] \right|^2 \Rightarrow \left| \frac{2}{3\pi} + \frac{2}{\pi} \right|^2 = \left| \frac{8}{3\pi} \right|^2 \end{aligned}$$

Ans. 74: (b)

Solution: (a) We know the invariant formula:

$$c^2 t_{12}'^2 - x_{12}'^2 = c^2 t_{12}^2 - x_{12}^2$$

in frame K' both events occur at same point then $x_{12}' = 0$ then

$$\begin{aligned} c^2 t_{12}'^2 &= c^2 t_{12}^2 - (x_2 - x_1)^2 = c^2 (t_2 - t_1)^2 - (x_2 - x_1)^2 \\ &= (ct_2 - ct_1)^2 - (x_2 - x_1)^2 = (6-1)^2 - (5-2)^2 = 16 \end{aligned}$$

$$t_{12}'^2 = \frac{16}{(3 \times 10^8)^2}$$

$$t_{12}' = \frac{4}{3 \times 10^8} \cong 1.3 \times 10^{-8} \text{ s} \cong 13 \text{ ns}$$

Ans. 75: (c)

$$\text{Solution: } \frac{\partial F}{\partial M} = 0 \Rightarrow F = -2aM + 6bM^5 = 0 \Rightarrow F = 2M(-a + 3bM^4) = 0 \Rightarrow M = \pm (a/3b)^{1/4}$$
